NON-BIOENGINEER STATEMENT

JINDAN Lactic acid is not expected to contain detectable amounts of genetically modified protein or DNA. Bioengineered organisms are not used in the manufacturing process. The vegetable oil and some minor components used in its manufacture are not traceable and may have been derived from genetically modified crops.

United States

The National Bioengineered Food Disclosure Law, passed by Congress in July of 2016, directed USDA to establish a national mandatory standard for disclosing foods that are or may be bioengineered. The National Bioengineered Food Disclosure Standard was published on December 20, 2018.

The Standard defines bioengineered foods as those that contain detectable genetic material that has been modified through certain lab techniques and cannot be created through conventional breeding or found in nature.

Vegetable oils extracted from oil seeds including corn, cottonseed, canola, and soybean are highly refined and processed, which is expected to remove all proteins that may carry genetic information.

Minor components of this product may be derived from agricultural materials. The crops used in the production of these materials are not traceable and may have been derived from genetically modified crops. The chemical processing of these components during manufacturing is expected to remove all proteins that may carry genetic information.

Under the USDA's National Bioengineered Food Disclosure Standard, JINDAN lactic acid is not considered to be bioengineered.
