PROCESS PREVENTIVE CONTROLS (P-PC) & CRITICAL CONTROL POINTS (CCP) INFORMATION

Process Controls	Hazard(s)	Parameters, values, or critical limits	Monitoring				Corrective Action	Verification	Records
			What	How	Frequency	Who			
17) Heat Treatment P-PC #1 (CCP)	Pathogenic microorganisms (if present) if product is not sufficiently heat treated.	Product must be heated while mixing, to the applicable parameters below: **EMC/NDF/NCF** = ≥180°F for a minimum of 2 minutes. **LB/LC** = ≥165°F for a minimum of 15 minutes. **PCP** = ≥167°F for a minimum of 5 minutes.	Temperature of product and the length of time at the temperature	The temperature of the product in the tank is monitored using the Honeywell Chart Recorder. The start time (once proper temperature is reached) and end time of the heat treatment are recorded on the Food Safety / HACCP Plan Preventive Control Log Sheet.	Every Batch Note: Blended finished products may not undergo a heat treatment, because they are made using intermediate products which have been heat treated. Heat treatments for intermediate products are documented on Food Safety / HAACP Plan Preventive Control Logs generated for each intermediate product.	Designated Trained Production Employees	If temperature **and** time requirements are not reached while the product is undergoing mixing, the product is chilled until a decision on further action is made by the Department Manager, and/or Quality Manager, and/or President. If the product has been packaged, it will be placed on REJECT until a decision on further action is made by the Department Manager, and/or Quality Manager, and/or President. Anytime proper temperature or time is not met, an investigation to determine the root cause must be conducted by the Department Manager and an Internal Non-Conformance Report must be completed.	The Food Safety / HACCP Plan Preventive Control Log Sheet is completed by a designated trained employee and the Honeywell Chart is stamped and filed in the Production Manager's office. The Production Manager reviews the Food Safety / HACCP Plan Preventive Control Log Sheet and the Honeywell Chart. A record review is performed by a PCQI or other authorized employee within 7 working days. The signed log sheet is kept on file in the Production Manager's office. Annual calibration of the Honeywell temperature probes. 22) In-Line Screening (Market Grade #14 Mesh, 0.05") P-PC #2 (CCP)	Foreign Materials such as paper, glass, metal, wood, string, and plastic, etc.	Product must pass through an intact 0.05" mesh screen prior to packaging.	In-Line Screen	The in-line screen is inspected for signs of damage or wear before and after packaging each batch of product in accordance with the In-Line Screen & Shaker Screen Check Procedure (FSQ-11.7.3.A). The in-line screen is inspected for foreign material before and after packaging each batch of product. Inspection results are recorded on a Food Safety / HACCP Plan Preventive Control Log Sheet.	Every Batch Note: Intermediate products may not be passed through an in-line screen prior to packaging. They are used as ingredients in other EMC/NDF/NCF/LB/LC finished products, which are passed through an in-line screen.	Designated Trained Production Employees	If the in-line screen is found to be defective, the Department Manager must be notified and the screen must be handled as non-conforming in accordance with the Equipment and Utensils Policy (FSQ-11.1.7). The product must be placed on REJECT until it can be run through an intact screen. An internal Non-Conformance Report must be completed to determine the cause of the screen wear or damage. If foreign material is found on the screen, the product is placed on REJECT until the source of the foreign material is determined and the product is determined to be safe. An Internal Non-Conformance Report must be completed.	A Food Safety / HACCP Plan Preventive Control Log Sheet is completed by designated employees and reviewed by the production manager. A record review is performed. The signed log sheet is kept on file in the production manager's office. A record review is performed by a PCQI or other authorized employee within 7 working days. The signed log sheet is kept on file in the Production Manager's office. ALLERGEN PREVENTIVE CONTROL INFORMATION

Allergen Control Process Step	Hazard(s)	Criterion	Monitoring				Corrective Action	Verification	Records
			What	How	Frequency	Who			
23) Assembly and Labeling of Pails, Boxes, and Drums A-PC #1	Undeclared Allergens (Milk Allergen)	All finished product labels must declare milk allergen present in the product.	The ingredient listing and allergen information on the finished product label is correct and matches the product.	The Production Manager or authorized senior production employee must visually check the finished product label prior to printing. The correct label must be placed on the batch sheet.	Each Batch	Production Manager or Authorized Senior Production Employee	If the label information is incorrect, the label must be corrected prior to printing.	Annual review/update of finished product ingredient lists and labels by the QA/Regulatory Department.	Finished product documentation Food Safety / HACCP Plan Preventive Control Log Sheet (FSQ-2.4.3.A.1)
			The finished product label must have the correct allergen information and match the product.	Production employees must visually check the finished product label against the label on the batch sheet prior to packaging. The label check is documented on a Food Safety / HACCP Plan Preventive Control Log Sheet.	Each Batch	Designated trained production employees	If the finished product labels do not match or have the correct allergen information, the Production Manager and QA Manager must be notified so the labels can be corrected. Incorrect labels must be destroyed. Identify the root cause to prevent recurrences. An Internal Non-Conformance Report must be completed.	A Food Safety / HACCP Preventive Control Log Sheet is completed by designated trained employees and is reviewed and approved by the Production Manager and designated HACCP certified employee. The signed log sheet is kept on file in the production manager's office. A record review is performed by a PCQI or other authorized employee within 7 working days. The signed log sheet is kept on file in the Production Manager's office.	Food Safety / HACCP Plan Preventive Control Log Sheet (FSQ-2.4.3.A.1) Corrective Action Reports

General Policies Related to Allergen Control

- Allergen Management Program (Policy No. FSQ-2.8.1)
- Color Coding Policy (Policy No. FSQ-2.8.1.B)
- Shipping & Receiving General Requirements and Procedures (SR-SOP-001)

SUPPLY CHAIN CONTROL INFORMATION

Ingredients, processing aids, and packaging are approved through the Approved Supplier Program. Hazards associated with ingredients, processing aids, and packaging are identified through the completion of Material Risk Assessments. For each material, any identified hazards that are deemed likely to pose a significant food safety risk must have an appropriate documented control prior to approval. The control may either be applied by the manufacturer or by Jeneil Biotech, Inc.

Certificates of Analysis must be received for all lots of incoming ingredients. The ingredients are placed on QUARANTINE in the ERP System upon receipt. The Quality Assurance Department reviews ingredient COA's, and if the COA's meet specification, the ingredient is released from QUARANTINE and can be used in production. Ingredients cannot be issued to a batch while on QUARANTINE.

General Policies Related to Supply Chain Control
